4	Statistics on the count of Dr.Nelson Following, values straight from R	16

#### Question

Determine if the friendship paradox holds for my Facebook account. Compute the mean, standard deviation, and median of the number of friends that my friends have. Create a graph of the number of friends (y-axis) and the friends themselves, sorted by number of friends (x-axis). (The friends don't need to be labeled on the x-axis: just f1, f2, f3, ... fn.) Do include me in the graph and label me accordingly.

This used to be more interesting when you could more easily download your friend's friends data from Facebook. Facebook now requires each friend to approve this operation, effectively making it impossible.

I will email to the list the XML file that contains my Facebook friendship graph ca. Oct, 2013. The interesting part of the file looks like this (for 1 friend):

Listing 1: mln.graphml

It is in GraphML format: http://graphml.graphdrawing.org/

#### Answer

A Python program,  $qet\_graphml.py$ , has been written to extract[1] number of friends that Dr. Nelson friends have. The program will search for this information in a file called mln.graphml [2]. The output of this program would be like the following:

Figure 1: Sample output of number of friends

```
77 Dale Andrews
8 Janet Schultz Brunelle
13 Justin F. Brunelle

```

Figure 2: Sample output of number of friends

```
\# -*- encoding: utf-8 -*-
   #! /usr/bin/python
  from __future__ import unicode_literals import xml.etree.cElementTree as et
   from bs4 import BeautifulSoup
6 from urlparse import parse_qs
   import unicodedata
   import urllib2
   import re
   import os
11 import sys
   print '%-15s %-20s' %('Friends-count', 'Friend-screen-name')
   file = "mln.graphml"
16 handler = open(file).read()
   soup = BeautifulSoup(handler)
   i = 0
   all = 0
   for message in soup.find all('node'):
21
       all += 1
       foo = et.XML(str(message))
       name =
       for e in foo:
           if ('graphml count' in str(e.items())):
26
                print '%-15s %-20s' %(e.text, name)
                with open ('friend_counts', 'a') as outfile:
                    outfile.write (\%-15s\%-20s\n\%(e.text,name))
           if ('name' in str(e.items())):
31
               name = e.text
   print "\nNumber of Dr. Nelson's friends ,who allow to retrieve their friends count, is "+str
       (i)+" out of "+str(all)
```

Listing 2: get\_graphml.py

I would like to let you know that even though Dr. Nelson have 319 friends, only 165 allow me to see their number of friends. This will affect the statistical result. For example, instead of dividing by 319 to get the mean, we divide by 165.

The graphml\_counts file was ordered in place with the Unix command in Listing 3.

```
Naina Sai Tipparti@DESKTOP-2FU7AJC ~/a4/q1 cat graphml_counts | sort -g -o graphml_counts
```

Listing 3: Sort command

This file was then processed by the R script[3] shown in Listing 4 to produce the graph in Figure 3

```
#! /usr/bin/Rscript
# read data
data <- read.table('D:/cs532/a4/q1/graphml_counts',sep=",")
x <- seq(1, length(data$V1))
y <- data$V1

# get notable values
mln_idx <- grep("phonedude_mln", data$V2)
med_val <- median(data$V1)
med_idx <- which(abs(y - med_val) == min(abs(y - med_val)))
mean_val <- mean(data$V1)
mean_idx <- which(abs(y - mean_val) == min(abs(y - mean_val)))</pre>
```

Listing 4: Graph Creation Script for Facebook

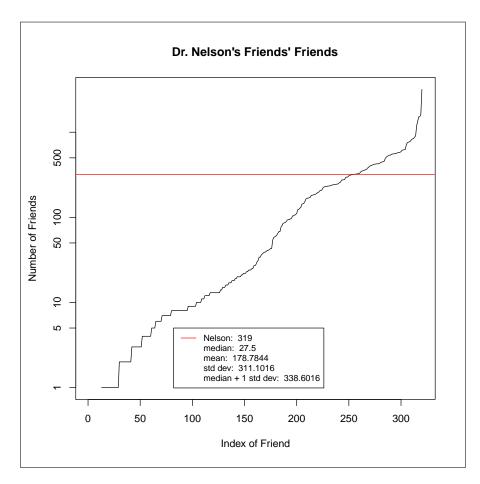

Figure 3: The Friendship Graph for Facebook

Mean	178.7844
$\mathbf{Median}$	27.5
$\operatorname{Std}$ $\operatorname{Dev}$	311.1016

Table 1: Statistics on the count of Dr. Nelson Facebook Friends' Friends, values straight from R

The median, mean and standard deviation were all calculated, with the median, mean and median plus one standard deviation.

### Question

Determine if the friendship paradox holds for your Twitter account. Since Twitter is a directed graph, use "followers" as value you measure (i.e., "do your followers have more followers than you?").

Generate the same graph as in question #1, and calcuate the same mean, standard deviation, and median values.

For the Twitter 1.1 API to help gather this data, see: https://dev.twitter.com/docs/api/1.1/get/followers/list If you do not have followers on Twitter (or don't have more than 50), then use my twitter account "phonedude mln".

#### Answer

Using Dr. Michael Nelson's Twitter account and the Twitter API [4], specifically the GET friends/list [5] request, all of Dr. Nelson's Twitter friends were obtained and saved to the file called followers. This method also uses the API's paginating scheme: when there are a large number of results for a query, the API will send a cursor index to show that there are more results to process and that more requests are needed. The code to do this is in Listing 5.

```
\# -*- encoding: utf-8 -*-
   from __future__ import unicode_literals
   import re
  import os
   import sys
   import json
   import requests
  import subprocess
9 from urlparse import parse qs
  from requests oauthlib import OAuth1
  REQUEST TOKEN URL = "https://api.twitter.com/oauth/request_token"
  AUTHORIZE URL = "https://api.twitter.com/oauth/authorize?oauth token="
14 ACCESS TOKEN URL = "https://api.twitter.com/oauth/access token"
  CONSUMER KEY = "lA3ACTYCPDE8G5rNYFBMI1hMm"
  CONSUMER SECRET = "4zGZNDRA2m32dsq7nCMfwJojGSanz6ohgf4ZaNWKDxCaabPUai"
  OAUTH TOKEN = "798668178-bH8DbMpNuWkfhAHxuODgWSHwQE65B1WZnc4Ahtej"
19 OAUTH TOKEN SECRET = "FhykPKnQcgKQBE43os2bDZ31ugH9RVSG3HYoOL7QG7RNC"
   def setup oauth():
       """Āuthorize your app via identifier."""
      # Request token
      oauth = OAuth1(CONSUMER_KEY, client_secret=CONSUMER_SECRET)
^{24}
      r = requests.post(url=REQUEST TOKEN URL, auth=oauth)
      credentials = parse qs(r.content)
      resource owner key = credentials.get('oauth token')[0]
29
      resource owner secret = credentials.get('oauth token secret')[0]
      # Authorize
```

```
authorize url = AUTHORIZE URL + resource owner key
       print 'Please go here and authorize: ' + authorize url
34
       verifier = raw input('Please input the verifier: ')
       oauth = OAuth1 (CONSUMER KEY,
                       client secret=CONSUMER SECRET,
                       resource owner key=resource owner key,
39
                       resource\_owner\_secret = resource\_owner\_secret \ ,
                       verifier = verifier)
       # Finally, Obtain the Access Token
       r = requests.post(url=ACCESS TOKEN URL, auth=oauth)
44
       credentials = parse\_qs(r.content)
       token = credentials.get ('oauth token')[0]
       secret = credentials.get('oauth token secret')[0]
       return token, secret
49
   def get oauth():
       oauth = OAuth1 (CONSUMER KEY,
                    client_secret=CONSUMER SECRET,
                    resource_owner_key=OAUTH_TOKEN,
resource_owner_secret=OAUTH_TOKEN_SECRET)
54
       return oauth
   59
           token, secret = setup_oauth()
           print "OAUTH TOKEN: "+ token
           print "OAUTH TOKEN SECRET: " + secret
           print
64
       else:
           twitterUser = "phonedude mln"
           print 'Searching Twitter for followers counts of '+twitterUser+" 's followers: "
           oauth = get oauth()
69
           print '%-15s %-20s' %('Followers count', 'Follower-screen-name')
           \# initial reading from the twitter account where cursor =-1 (e.g. first page)
           r = requests.get(url="https://api.twitter.com/1.1/followers/list.json?cursor=-1&
                count=2000&screen name="+twitterUser+"&skip status=true&include user entities=
                false", auth=oauth)
           counter = 0
74
           res = r.json()
           while True:
                raw_res = res['users']
                for init url in raw res:
79
                    counter = counter + 1
                    print '%-15d %-20s' %(init_url['followers_count'],init_url['screen_name'].
    encode('ascii', 'replace'))
with open('friend_counts', 'a') as outfile:
                        outfile.write('%-15d %-20s\n' %(init url['followers count'], init url['
                             screen_name'].encode('ascii', 'replace')))
                if str(res['next_cursor']) == '0':
                    break
84
                else:
                    r = requests.get(url="https://api.twitter.com/1.1/followers/list.json?cursor
                        ="+str(res['next_cursor'])+"&count=100&screen_name="+twitterUser+"&
                        skip status=true&include user entities=false", auth=oauth)
                    res = r.json()
89 print '\nNumber of '+twitterUser+"' s followers is: "+str(counter)
```

Listing 5: get followers.py

To reduce the impact of high HTTP traffic, the Twitter API[4] rate-limits most requests – the one needed to obtain a user's friends list[?] has a limit of fifteen message per fifteen minutes. Any requests received from a user or service that has reached the limit will be depied

The friends of Dr. Nelson's friends were then obtained with the same get\_followers method from Listing 5 and stored in a file called followers\_counts, each on a single line preceded by their friend count. All of these operations were controlled by a main method, which is shown in Listing 5.

The followers\_counts file was ordered in place with the Unix command in Listing 6.

```
Naina Sai Tipparti@DESKTOP-2FU7AJC ~/a4/q2 cat followers_counts | sort -g -o followers_counts
```

Listing 6: Sort command

This file was then processed by the R script shown in Listing 7 to produce the graph in Figure 4

```
#! /usr/bin/Rscript
  # read data
  data <- read.table('D:/cs532/a4/q2/followers counts')
  x \leftarrow seq(1, length(data$V1))
  y < - data$V1
  # get notable values
  mln_idx <- grep("phonedude_mln", data$V2)
   med val <- median (data$V1)
  med idx \leftarrow which(abs(y - med val)) = min(abs(y - med val)))
  mean val <- mean(data$V1)
  mean\ idx \leftarrow which(abs(y - mean\ val) = min(abs(y - mean\ val)))
14 std dev <- sd(data$V1)
  # draw the graph
   pdf("D:/cs532/a4/q2/followers_plot.pdf")
  plot(x, y, type="l", log="y", pch=19, main="Dr. Nelson's Friends', ylab="Number of Friends", xlab="Index of Friend")
  # illustrate points of interest
  abline (h=data$V1[mln idx], col="red")
24 # The Legend of the Data
   legend(x=82, y=5, cex=0.8, lty=c(1, 1),
      col=c("red", "white", "white", "white", "white"),
      29
           paste("median + 1 std dev: ", format(round(med val + std dev, 4), nsmall = 4))))
   dev.off()
```

Listing 7: Graph Creation Script for Twitter

Mean	1024.7424
$\mathbf{Median}$	258
Std Dev	4135.7974

Table 2: Statistics on the count of Dr.Nelson Followers, values straight from R

The median, mean and standard deviation were all calculated, with the median, mean and median plus one standard deviation.

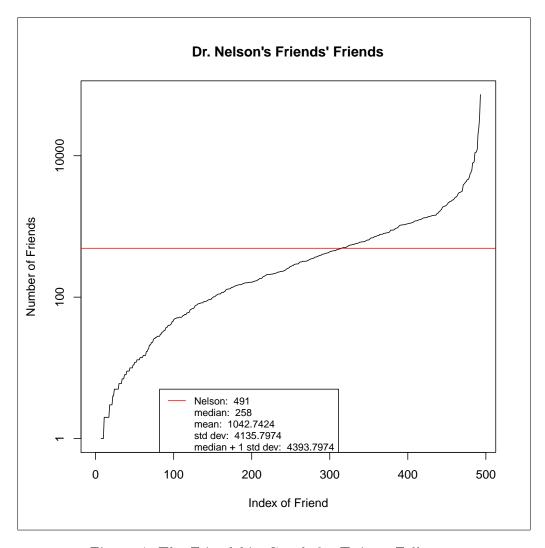

Figure 4: The Friendship Graph for Twitter Followers

#### Question

Repeat question #1, but with your LinkedIn profile.

#### Answer

Fortunately, linkedIn provides information about connections (people) through an API[6]. I have written a Python program,  $qet\_linkedin$ , that requests[7] data from linkedIn and saves the output into linkedin count.

```
\# -*- encoding: utf-8 -*-
   #! /usr/bin/python
   from __future__ import unicode_literals
4 import xml.etree.cElementTree as et
   from bs4 import BeautifulSoup
   from urlparse import parse qs
   import unicodedata
   import urllib2
9 import re
   import os
   import sys
   import oauth2 as oauth
   import time
14
   consumer = oauth.Consumer(
        key="",
        secret = "")
   token = oauth. Token (
        пπ,
19
        secret=""
   client = oauth.Client(consumer, token)
24 \mid url = "http://api.linkedin.com/v1/people/~/connections:(num-connections, first-name, last-name)
   resp, content = client.request(url)
   soup = BeautifulSoup (content)
   i = 0
29 \mid a \mid 11 = 0
   print '%-15s %-20s' %('Connections', 'LinkedIn User Name')
   for message in soup.find all('person'):
       all += 1
       if len(message.find all('num-connections')) > 0:
34
           fullName = message.find('first-name').text+' '+ message.find('last-name').text
           print '%-15s %-20s' %(message.find('num-connections').text, fullName) with open('linkedin', 'a') as outfile:
                outfile.write('%-15d %-20s\n' %(init url['friends count'],init url['screen name'
                    ].encode('ascii', 'replace')))
39
   print "\nNumber of Naina Sai's LinkedIn connections is "+str(all)+'(can not retrieve data of
        '+str(all - i)+'connection(s)
```

Listing 8: get linkedin.py

I would like indicate here that the API that LinkedIn provides returns no more than 500 connection. In other words, if I have someone in my connection has more than 500 connections. LinkedIn will give me this person has 500+.

The linkedin\_count file was ordered in place with the Unix command in Listing 9.

```
Naina Sai Tipparti@DESKTOP-2FU7AJC ~/a4/q3 cat linkedin_count | sort -g -o linkedin_count
```

Listing 9: Sort command

This file was then processed by the R script shown in Listing 10 to produce the graph in Figure 5

```
#! /usr/bin/Rscript
 4 data <- read.table('D:/cs532/a4/q3/linkedin count', sep=",")
   x \leftarrow seq(1, length(data$V1))
   y < - data $V1
   # get notable values
9 | idx <- grep("Naina Sai Tipparti", data$V2)
   med val <- median (data$V1)
   med\_idx <- which(abs(y - med\_val) == min(abs(y - med val)))
   mean val <- mean(data$V1)
   mean idx \leftarrow which(abs(y - mean val) = min(abs(y - mean val)))
14 std dev <- sd(data$V1)
   # draw the graph
   pdf("D:/cs532/a4/q3/linkedin plot.pdf")
   plot(x, y, type="l", log="y", pch=10, main="Naina Sai Tipparti Linkedin Friends", ylab="Number of Friends", xlab="Index of Friends")
   # illustrate points of interest
   abline (h=data$V1[idx], col="red")
24 # The Legend of the Data
   legend(x=82, y=5, cex=0.8, lty=c(1, 1),
       col=c("red", "white", "white", "white", "white"),
c(paste("Naina Sai Tipparti: ", data$V1[idx]), paste("median: ", med_val),
            paste("mean: ", format(round(mean_val, 4), nsmall = 4)),
29
            paste("std dev: ", format(round(std_dev, 4), nsmall = 4)),
            paste("median + 1 std dev: ", format(round(med_val + std_dev, 4), nsmall = 4))))
   dev.off()
```

Listing 10: Graph Creation Script for LinkedIn

Mean	156.875
Median	95
Std Dev	154.6315

Table 3: Statistics on the count of Naina Sai Tipparti's LinkedIn, values straight from R

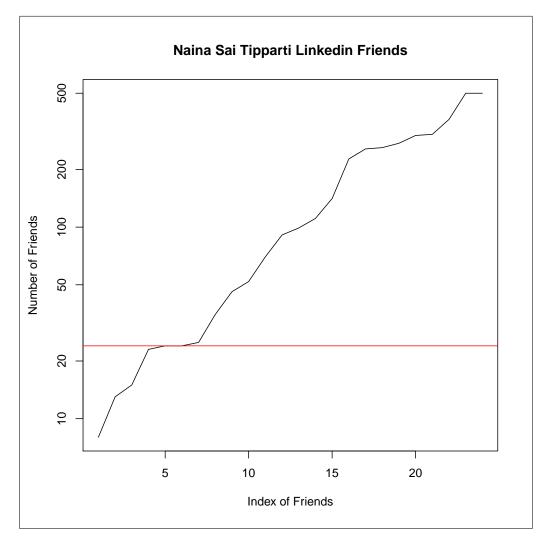

Figure 5: The Friendship Graph for LinkedIn

I have number of connections which is a way less than the mean, but we can not conclude from the above statistics that the friendship paradox holds for My LinkedIn account since must of my connections have connections greater the mean.

### Question

Repeat question #2, but change "follower" to "following"? In other words, are the people I am following following more people?

#### Answer

Same instructions explained in question 2 are used to answer this question. As I remember, only one change has been made to *qet followers.py*.

#### • The old request:

```
r = requests.get(url="https://api.twitter.com/1.1/followers/list.json?cursor
=-1&count=2000&screen_name="+twitterUser+"&skip_status=true&include_user_entities=false", auth=oauth)
```

Listing 11: get followers.py

#### • After modifying:

```
r = requests.get(url="https://api.twitter.com/1.1/friends/list.json?cursor=-1&count=2000&screen_name="+twitterUser+"&skip_status=true&include_user_entities=false", auth=oauth)
```

Listing 12: get friends.py

All new changes are stored in a new file called  $qet\_friends.py[8]$ . The following is the output after running the Python program:

Figure 6: Sample output of number of following

Mean	484.9214
$\mathbf{Median}$	225
Std Dev	729.5275

Table 4: Statistics on the count of Dr.Nelson Following, values straight from R

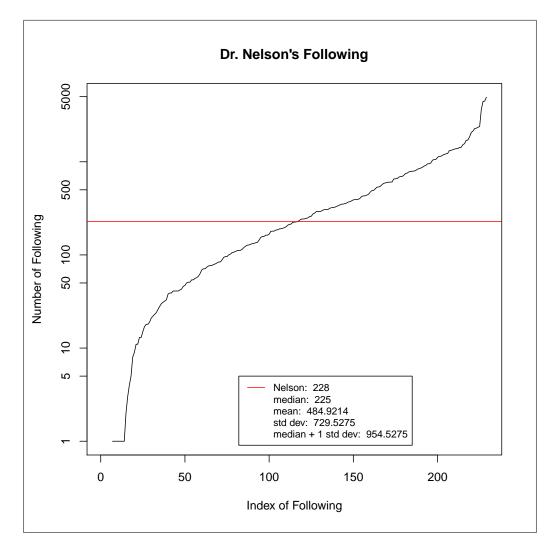

Figure 7: The Friendship Graph for Twitter Following

I think here also the friendship paradox holds for Dr. Nelson Twitter account (for following) since the mean is equal to 484.9214 which greater than most of the number of following of Dr. Nelson following including himself.
